

Prompt Engineering Contest

Use Case (Non tech):

"Use AI to Summarize Client Feedback and Suggest Actionable Improvements"

Background Context:

You work in a **customer success or project management** role. Your team has received a long set of **open-text client feedback responses** from a recent software rollout. The feedback includes both positive remarks and complaints, as well as suggestions for improvement.

You're now using an **AI assistant** to help:

- **Summarize the feedback** by identifying key themes (e.g., UI issues, performance, communication gaps)
- Highlight **positive insights**
- List **actionable suggestions** to improve future deliveries
- Generate a brief **executive summary** for leadership
- Categorize feedback as **Positive / Negative / Neutral**

Your Task (as Prompt Engineers):

Write a clear, structured prompt that instructs an AI assistant to:

1. Analyze a block of customer feedback text (provided or referenced)
2. Extract common **themes or pain points**
3. Suggest **specific, realistic improvements**
4. Output the result in a professional format, such as:
 - Markdown with headers
 - A table with categories (Issue | Insight | Suggested Action)
 - A summary paragraph for a stakeholder report

Objective:

Create a **well-structured prompt** that helps AI consistently return:

- A categorized summary of feedback
- Actionable improvements
- A professional tone suitable for sharing with internal teams

 **Time Limit:** 15 minutes

 **Evaluation Criteria:**

- Clarity and completeness of the prompt
- Effective use of structure and roles
- Alignment of AI output with business reporting needs
- Use of prompting techniques (zero-shot, chain-of-thought, etc.)
